## **DETAILED ACTION**

### ***Oath/Declaration***

1. The oath or declaration is defective. A new oath or declaration in compliance with 37 CFR 1.67(a) identifying this application by application number and filing date is required. See MPEP §§ 602.01 and 602.02.

The oath or declaration is defective because:

It erroneously identifies Application 09/973,432 as the parent application to which priority is claimed. The correct Application is 09/793,432.

### ***Specification***

2. The abstract of the disclosure is objected to because the word "overlapping" is misspelled (it is identified as "overlap ping"). Correction is required. See MPEP § 608.01(b).

### ***Claim Objections***

3. Claim 25 is objected to because of the following informalities: "An system" should be --A system--. Appropriate correction is required.

### ***Claim Rejections - 35 USC § 102***

4. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

Art Unit: 2884

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

5. Claim 25 is rejected under 35 U.S.C. 102(e) as being clearly anticipated by Cusack et al. (U. S. Patent 6,135,760) or VonDrasek et al. (U. S. Patent 6,244,857).

Cusack as well as VonDrasek disclose a system for monitoring a combustion flame, the system comprising means for monitoring an optical emission spectrum of the combustion flame in at least one bandwidth associated with one impurity (OH) and means for generating an impurity signal indicative of the presence or absence of the at least one impurity.

***Allowable Subject Matter***

6. Claims 1-24, 26-27 are allowed.
7. The following is a statement of reasons for the indication of allowable subject matter: There is no evidence in the prior art searched of a flame monitoring and flame temperature determining system where the temperature of the flame is determined from the ratio of the first and second integrated intensities, which intensities are generated by the at least two photodetectors in the system having different overlapping bandwidths in the UV emission band. Prior references, such as VonDrasek (6,244,857) disclose generating integrated intensities, however, it does not disclose taking the ratio of the generated integrated intensities obtained by two detectors with different and overlapping

Art Unit: 2884

bandwidths in the UV emission band, in order to obtain the temperature of the flame monitored.
